TASK 5 – CYBERCRIME AWARENESS

CYBERCRIME CASE STUDY

Topic: Phishing Attack

Phishing is a type of cybercrime where attackers trick individuals into revealing sensitive information such as passwords, bank details, or OTPs. This is usually done through fake emails, messages, or websites that appear to be legitimate.

In a typical phishing attack, a user receives an email that looks like it is from a trusted organization, such as a bank. The email asks the user to click on a link and update their account details. The link redirects to a fake website that looks identical to the real one. When the user enters their details, the attacker captures the information.

Students and working professionals are common targets because they frequently use online services. The consequences can include financial loss, identity theft, and unauthorized access to accounts.

Phishing attacks are increasing due to lack of awareness and careless online behaviour. Therefore, it is important to verify sources and avoid clicking on suspicious links.
